Basic Integration Techniques

Understanding basic integration techniques is fundamental for solving a wide variety of integral problems. This section covers the simplest forms of integration, including power rules, constant multiples, and sums of functions. Mastery of these basics is crucial before progressing to more complex methods.

Power Rule for Integration

The power rule is the most straightforward integration technique. For any real number $n \neq -1$, the integral of x raised to the power n is given by:

$$\int x^n dx = (x^{n+1}) / (n + 1) + C$$

This rule is frequently used in solving polynomial integrals and forms the basis for many other techniques.

Integration of Constants and Sum of Functions

Integrating a constant or a sum of functions follows linearity rules:

- $\int a \, dx = a x + C$, where a is a constant.
- $\int [f(x) + g(x)] \, dx = \int f(x) \, dx + \int g(x) \, dx$, which allows the separation of integrals.

These properties simplify complex integrals by breaking them into manageable parts.

Integration by Substitution

Integration by substitution is a powerful technique used to simplify integrals by changing variables. This method is particularly useful when the integral contains a composite function.

Understanding Substitution Method

The key idea is to select a substitution $u = g(x)$ such that the integral in terms of x transforms into an integral in terms of u , which is easier to evaluate. The differential $du = g'(x) \, dx$ replaces part of the integrand.

Example Problem and Solution

Evaluate $\int 2x \cos(x^2) \, dx$.

Solution: Let $u = x^2$. Then, $du = 2x \, dx$, which matches the factor $2x \, dx$ in the integral.

Rewrite the integral as $\int \cos(u) \, du$, which equals $\sin(u) + C$. Substituting back, the final answer is $\sin(x^2) + C$.

Integration by Parts

Integration by parts is useful when the integrand is a product of two functions that are not easily integrable directly. It is based on the product rule for differentiation and helps transform the integral into a simpler form.

Formula and Explanation

The formula for integration by parts is:

$$\int u \, dv = uv - \int v \, du$$

Here, u and dv are parts of the original integrand chosen to simplify the integral after applying the formula.

Sample Problem with Solution

Evaluate $\int x e^x dx$.

Solution: Choose $u = x$ (so that $du = dx$) and $dv = e^x dx$ (so that $v = e^x$).

Applying the formula gives:

$$\int x e^x dx = x e^x - \int e^x dx = x e^x - e^x + C.$$

Integration Using Partial Fractions

Partial fractions decomposition simplifies the integration of rational functions by expressing the integrand as a sum of simpler fractions. This technique is particularly effective when integrating rational expressions with polynomial denominators.

Steps in Partial Fraction Decomposition

The general steps include:

1. Factor the denominator into linear or irreducible quadratic factors.
2. Express the integrand as a sum of partial fractions with unknown coefficients.
3. Determine the coefficients by equating numerators or substituting values of x .
4. Integrate each partial fraction separately.

Example Problem and Solution

Evaluate $\int (3x + 5) / (x^2 - x - 2) dx$.

Solution: Factor the denominator: $x^2 - x - 2 = (x - 2)(x + 1)$.

Express as partial fractions:

$$(3x + 5) / (x - 2)(x + 1) = A / (x - 2) + B / (x + 1).$$

Multiply both sides by the denominator and solve for A and B:

$$3x + 5 = A(x + 1) + B(x - 2).$$

Setting $x = 2$: $3(2) + 5 = A(3) + B(0) \Rightarrow 11 = 3A \Rightarrow A = 11/3$.

Setting $x = -1$: $3(-1) + 5 = A(0) + B(-3) \Rightarrow 2 = -3B \Rightarrow B = -2/3$.

Integrate each term:

$$\int (11/3) / (x - 2) dx + \int (-2/3) / (x + 1) dx = (11/3) \ln|x - 2| - (2/3) \ln|x + 1| + C.$$

Integration of Trigonometric Functions

Trigonometric integrals often require specialized techniques including substitution, identities, and reduction formulas. Mastery of trigonometric integration is essential for tackling a wide array of calculus problems.

Common Trigonometric Integrals

Some frequently encountered integrals include:

- $\int \sin(x) \, dx = -\cos(x) + C$
- $\int \cos(x) \, dx = \sin(x) + C$
- $\int \sec^2(x) \, dx = \tan(x) + C$
- $\int \csc^2(x) \, dx = -\cot(x) + C$

Example: Integration Using Trigonometric Identities

Evaluate $\int \sin^2(x) \, dx$.

Solution: Use the identity $\sin^2(x) = (1 - \cos(2x)) / 2$.

Rewrite the integral as:

$$\int (1/2) \, dx - \int (\cos(2x)/2) \, dx = (x / 2) - (1/4) \sin(2x) + C.$$

Improper Integrals and Definite Integrals

Improper integrals involve infinite limits or integrands with infinite discontinuities. Definite integrals evaluate the net area under a curve within specific bounds. This section addresses evaluation techniques and convergence criteria for improper integrals.

Evaluating Improper Integrals

Improper integrals are evaluated by taking limits of definite integrals as the bounds approach infinity or points of discontinuity.

Example:

Evaluate $\int_1^{\infty} 1/x^2 \, dx$.

Rewrite as limit:

$$\lim_{t \rightarrow \infty} \int_1^t x^{-2} \, dx = \lim_{t \rightarrow \infty} [-1/x]_1^t = \lim_{t \rightarrow \infty} (-1/t + 1) = 1.$$

Definite Integral with Application

Calculate the area under the curve of $f(x) = x^2$ from $x = 0$ to $x = 2$.

$$\int_0^2 x^2 dx = [x^3 / 3]_0^2 = (8/3) - 0 = 8/3.$$

Advanced Integration Problems

This section includes challenging problems involving multiple integration techniques, such as trigonometric substitution, reduction formulas, and integrals involving special functions. These problems are ideal for advanced learners seeking to deepen their understanding.

Trigonometric Substitution

Trigonometric substitution simplifies integrals involving square roots of quadratic expressions by substituting variables with trigonometric functions.

Example Problem

Evaluate $\int dx / \sqrt{a^2 - x^2}$.

Solution: Use the substitution $x = a \sin \theta$, so that $dx = a \cos \theta d\theta$ and the square root simplifies to $a \cos \theta$.

The integral becomes:

$$\int (a \cos \theta d\theta) / (a \cos \theta) = \int d\theta = \theta + C.$$

Re-substitute $\theta = \arcsin(x/a)$ to get:

$$\arcsin(x/a) + C.$$

Reduction Formulas

Reduction formulas express complicated integrals in terms of simpler ones of the same type. They are especially useful for powers of trigonometric functions or polynomials.

Example: Reduction Formula for $\int \sin^n(x) dx$

The reduction formula is:

$$\int \sin^n(x) dx = - (1/n) \sin^{n-1}(x) \cos(x) + ((n - 1)/n) \int \sin^{n-2}(x) dx.$$

This formula reduces the power n step-by-step until the integral becomes manageable.
