Understanding the Concept of 10 Times the Value of a Digit

The concept of 10 times the value of a digit is fundamental in grasping the base-10 number system. When a digit is multiplied by 10, its place value increases by one position to the left, effectively making the digit ten times larger. For example, the digit 3 in the ones place becomes 30 when multiplied by 10, as it moves to the tens place. This principle is key to understanding multiplication, place value, and number sense.

Place Value and Its Role

Place value explains the value of a digit depending on its position within a number. The base-10 system uses powers of ten to assign values to digits. In this system, each step to the left represents a multiplication by 10. Understanding how digits shift positions and how their values change is crucial for applying multiplication concepts correctly.
