create learn diy construction kit: Connected Code Yasmin B. Kafai, Quinn Burke, 2016-09-02 Why every child needs to learn to code: the shift from "computational thinking" to computational participation. Coding, once considered an arcane craft practiced by solitary techies, is now recognized by educators and theorists as a crucial skill, even a new literacy, for all children. Programming is often promoted in K-12 schools as a way to encourage "computational thinking"—which has now become the umbrella term for understanding what computer science has to contribute to reasoning and communicating in an ever-increasingly digital world. In *Connected Code*, Yasmin Kafai and Quinn Burke argue that although computational thinking represents an excellent starting point, the broader conception of "computational participation" better captures the twenty-first-century reality. Computational participation moves beyond the individual to focus on wider social networks and a DIY culture of digital "making." Kafai and Burke describe contemporary

examples of computational participation: students who code not for the sake of coding but to create games, stories, and animations to share; the emergence of youth programming communities; the practices and ethical challenges of remixing (rather than starting from scratch); and the move beyond stationary screens to programmable toys, tools, and textiles.

create learn diy construction kit: Disaster Education John Preston, 2012-09-11 From 'Duck and Cover' in the 1950s, when American schoolchildren were instructed to hide beneath their desks in the event of nuclear attack to contemporary campaigns against pandemic flu, education campaigns have been used to prepare the general public for apocalyptic events. Governments have made use of various media from films, leaflets and television to the internet to inform, inspire and scare populations. Forms of disaster education also permeate popular culture with films and television programmes illustrating survival techniques from dealing with terrorist attacks in '24' to thwarting zombie apocalypse in 'The Walking Dead' and '28 Days Later' . Using critical race theory and whiteness studies the book argues that information about disasters has always, tacitly or overtly, prioritised the survival of certain groups of citizens above others. Drawing on examples from the UK and the US, from past and contemporary disaster education and popular culture, it considers that rather than being kitsch, naïve and ephemeral, such campaigns are central to the way in which states define survival, life and death. The book will be of interest to educationalists, historians, sociologists and cultural theorists as well as those working in emergency planning, public health and communications.
