Essential ICU Monitoring Parameters

Accurate monitoring is fundamental in the intensive care unit to assess patient status and detect early signs of deterioration. The ICU cheat sheet includes key vital signs and laboratory values that require close observation.

Vital Signs

Vital signs provide immediate information on a patient's hemodynamic and respiratory status. The primary parameters monitored include:

- **Heart Rate:** Normal adult range is 60-100 beats per minute; tachycardia or bradycardia may indicate underlying pathologies.
- **Blood Pressure:** Systolic and diastolic values guide fluid management and vasopressor therapy; mean arterial pressure (MAP) above 65 mmHg is typically targeted.

- **Respiratory Rate:** Normal range is 12-20 breaths per minute; changes may reflect respiratory distress or metabolic imbalances.
- **Oxygen Saturation (SpO2):** Maintained above 92% in most ICU patients, with adjustments based on clinical context.
- **Temperature:** Monitoring for fever or hypothermia is vital as it may signal infection or other systemic issues.

Laboratory Values

Laboratory monitoring is critical to guide therapy and evaluate organ function. Important lab values include:

- **Arterial Blood Gases (ABGs):** Assess oxygenation, ventilation, and acid-base status.
- **Complete Blood Count (CBC):** Monitors for anemia, infection, and platelet count.
- **Electrolytes:** Sodium, potassium, calcium, magnesium, and phosphate levels require frequent assessment for balance.
- **Renal Function Tests:** Blood urea nitrogen (BUN) and creatinine levels guide fluid and medication management.
- **Liver Function Tests:** Evaluate hepatic metabolism and detect injury.

Common ICU Medications and Dosages

Pharmacologic management in the ICU involves a wide range of medications. The ICU cheat sheet highlights common drugs, their indications, and standard dosages to assist in rapid decision-making.

Vasopressors and Inotropes

These agents support cardiovascular function in shock states and heart failure.

- **Norepinephrine:** First-line vasopressor for septic shock; starting dose 0.01-3 mcg/kg/min.

- **Vasopressin:** Adjunct vasopressor; typically 0.03 units/min.
- **Dobutamine:** Inotrope used in cardiogenic shock; dose range 2-20 mcg/kg/min.
- **Epinephrine:** Used for cardiac arrest and anaphylaxis; dosing varies by indication.

Analgesics and Sedatives

Proper sedation and pain control are vital for patient comfort and safety.

- **Fentanyl:** Opioid analgesic; IV infusion starting at 25-50 mcg/hr.
- **Midazolam:** Benzodiazepine sedative; dose 1-5 mg/hr IV infusion.
- **Propofol:** Sedative-hypnotic; infusion range 5-50 mcg/kg/min.
- **Dexmedetomidine:** Sedation with minimal respiratory depression; 0.2-1.5 mcg/kg/hr.

Antibiotics

Empiric and targeted antibiotic therapy is often required in critically ill patients.

- **Vancomycin:** For MRSA coverage; dosing guided by levels, typically 15-20 mg/kg every 8-12 hours.
- **Piperacillin/Tazobactam:** Broad-spectrum beta-lactam; 3.375-4.5 g every 6-8 hours.
- **Levofloxacin:** Respiratory and urinary infections; 500-750 mg daily.

Ventilator Management Basics

Mechanical ventilation is a cornerstone of ICU care. The ICU cheat sheet outlines fundamental ventilator settings and weaning criteria to optimize respiratory support.

Common Ventilator Modes

Understanding ventilator modes enables tailored respiratory support based on patient needs.

- **Assist-Control (AC):** Delivers set tidal volume or pressure with each breath, either mandatory or patient-triggered.
- **Pressure Support Ventilation (PSV):** Patient initiates breaths with support to overcome airway resistance.
- **Continuous Positive Airway Pressure (CPAP):** Maintains positive airway pressure during spontaneous breathing.
- **Synchronized Intermittent Mandatory Ventilation (SIMV):** Allows spontaneous breaths alongside mandatory breaths.

Key Ventilator Settings

Initial ventilator parameters must balance oxygenation and lung protection.

- **Tidal Volume (V_t):** Typically 6-8 mL/kg of ideal body weight to prevent volutrauma.
- **Respiratory Rate:** 12-20 breaths per minute, adjusted to maintain adequate ventilation.
- **FiO₂:** Fraction of inspired oxygen, titrated to maintain SpO₂ above 92%.
- **Positive End-Expiratory Pressure (PEEP):** Usually 5 cm H₂O or higher to improve oxygenation and prevent alveolar collapse.

Weaning Criteria

Successful liberation from mechanical ventilation requires careful assessment.

- Stable hemodynamics without vasopressor support.
- Adequate oxygenation: PaO₂/FiO₂ ratio > 150-200.
- Minimal secretions and ability to protect airway.

- Spontaneous breathing trial tolerance.

Critical Care Protocols and Guidelines

Protocols standardize ICU care to improve safety and efficacy. The cheat sheet provides summaries of key guidelines used in critical care practice.

Sepsis Management

Early recognition and treatment of sepsis are vital to reduce mortality.

- Prompt blood cultures and antibiotic administration within 1 hour.
- Fluid resuscitation with 30 mL/kg crystalloid for hypotension or lactate ≥ 4 mmol/L.
- Vasopressor initiation to maintain MAP ≥ 65 mmHg if hypotension persists.
- Monitoring lactate clearance and organ function.

ARDS Management

Acute respiratory distress syndrome requires lung-protective strategies.

- Low tidal volume ventilation (4-6 mL/kg ideal body weight).
- Limiting plateau pressures to ≤ 30 cm H₂O.
- Prone positioning for severe hypoxemia.
- Conservative fluid management to avoid overload.

Deep Vein Thrombosis (DVT) Prophylaxis

Preventing thromboembolism is crucial in immobilized ICU patients.

- Pharmacologic prophylaxis with low molecular weight heparin or unfractionated heparin.
- Mechanical methods such as compression stockings or intermittent pneumatic compression devices.
- Regular assessment for bleeding risk and contraindications.

Emergency Procedures in the ICU

Rapid response to emergencies can be lifesaving. The ICU cheat sheet includes protocols for common critical events and their management.

Cardiac Arrest

Advanced cardiac life support (ACLS) guidelines direct resuscitation efforts.

- Immediate recognition and initiation of high-quality CPR.
- Early defibrillation for shockable rhythms.
- Administration of epinephrine every 3-5 minutes during resuscitation.
- Airway management and ventilation support.

Rapid Sequence Intubation (RSI)

RSI is employed for emergency airway control.

- Pre-oxygenation with 100% oxygen for 3-5 minutes.
- Use of induction agents such as etomidate or ketamine.
- Administration of paralytics like succinylcholine or rocuronium.
- Preparation of airway equipment and monitoring during intubation.

Management of Acute Respiratory Failure

Immediate assessment and intervention are critical to prevent deterioration.

- Identify underlying cause (e.g., pneumonia, pulmonary edema, COPD exacerbation).
- Oxygen therapy to maintain adequate saturation.
- Consider non-invasive ventilation or mechanical ventilation if indicated.
- Close monitoring for signs of fatigue or worsening respiratory distress.

icu cheat sheet: Families in the Intensive Care Unit Ashlee J. Vance, Deena Kelly Costa, Giora Netzer, 2025-05-09 This first edition of this text was the first book to comprehensively survey the challenges in understanding and working with families whose loved ones are critically ill. The comprehensive nature of that book served as a state-of-the-art reference in this sphere for a broad spectrum of researchers and clinicians. All chapters were authored by established experts in the respective fields, providing an overview that has been used both in theory and practice. Since the first edition's publication, the public recognition of the importance of families has increased dramatically as a consequence of the COVID-19 pandemic. Most major decisions in the intensive care unit (ICU) are shared by clinicians and someone other than the patient. Improving communication between clinicians and these surrogate decision-makers has proven hard in multiple clinical trials. Families suffer, too, when their loved ones are critically ill. Anxiety, stress, and depression are common, and post-traumatic stress disorder may occur while their loved ones are still in the ICU. Families struggle to understand prognoses, and conflicts with the care team occur frequently. These conflicts not only injure families but also contribute to health care provider burnout. Now in its fully revised and expanded second edition, Families in the Intensive Care Unit reflects lessons learned during the COVID pandemic response, as well as knowledge gained about family support when families cannot be at the bedside. The chapter subjects again reflect a combination of breadth and depth. Physical and psychological morbidity are explored as barriers to effective decision-making, as are cognitive challenges. The full array of the interdisciplinary and interprofessional team is represented, emphasizing the multimodal approach. This edition includes administrative considerations for health care management and approaches for training members of the health care team. Similarly, family voices are also represented. The complete trajectory of needs of care are addressed, including survivorship and end-of-life care.
