potential software development clients: Buying into the Environment Christoph Erdmenger,

2017-09-08 Green purchasing - or eco-procurement - by local and central governments has long been recommended in documents such as Agenda 21 to be a key - although sometimes supplemental-ingredient in the achievement of more environmentally responsible economies. Certainly, sustainable consumption cannot be considered a realistic goal without the full engagement of public authorities. Many initiatives have been undertaken in OECD countries, most successfully in Japan and Denmark where green public purchasing has been proven to be workable and highly effective, while, in other countries, city municipalities have successfully pioneered the development of sophisticated public environmental purchasing policies. However, for the vast majority of countries and their major cities, the potential for green public purchasing remains woefully untapped. A key question is what would be the environmental impact if the majority of cities in Europe replicated the success stories of those leading the way? Public procurement has, after all, been an important tool in achieving other public policy goals such as defence. Why should it not be used as a tool to defend the environment? The RELIEF project, funded by the EU's City of Tomorrow and Cultural Heritage programme was established to answer exactly this question: to define the true potential of eco-procurement and to develop a strategy for change in Europe. Buying into the Environment is the result of the research segment of the project which has now been completed. A further stage-to design a Europe-wide action plan will follow in 2004. The book, organised under the auspices of the International Council on Local Environmental Initiatives (ICLEI) analyses national approaches already tested, and provides in-depth surveys on the pioneer cities such as Hamburg, Malmo and Zurich. Serious attention is given to city-specific hurdles which have been faced and overcome. The most relevant product groups for eco-procurement such as construction, transport, energy, information technology, furniture and food. are also analysed. Uniquely, the book also provides calculations on the environmental benefits potentially achievable through greener purchasing. Tools were developed and tested by the RELIEF researchers on the environmental assessment of products, public buying power and on evaluations of market conditions in order to provide scenarios for the application of green purchasing at a European level. The conclusions are that there is huge potential for both local and central governments to adapt their behaviour patterns and purchase in a more environmentally responsible way. For example, 18% of the EU's Kyoto Protocol commitment could be achieved if major cities in the European Union purchased green electricity. The results are complemented by new ideas on how best to foster innovation in public contractual arrangements-to encourage the development of products such as super-energy-efficient computers and fuel cells-and how the legal system may require adaptation and reform. The results presented in this book will provide an indispensable resource for municipalities, governments, researchers and business practitioners looking for answers on how public procurement can have a fundamental and manifestly positive effect on the environment.

potential software development clients: Extreme Programming and Agile Processes in Software Engineering Hubert Baumeister, Michele Marchesi, Mike Holcombe, 2005-06-13 Extreme Programming has come a long way since its first use in the C3 project almost 10 years ago. Agile methods have found their way into the mainstream, and at the end of last year we saw the second edition of Kent Beck's book on Extreme Programming, containing a major refactoring of XP. This year, the 6th International Conference on Extreme Programming and Agile Processes in Software Engineering took place June 18-23 in Sheffield. As in the years before, XP 2005 provided a unique forum for industry and academic professionals to discuss their needs and ideas on Extreme Programming and agile methodologies. These proceedings reflect the activities during the conference which ranged from presentation of research papers, invited talks, posters and demonstrations, panels and activity sessions, to tutorials and workshops. Included are also papers from the Ph.D. and Master's Symposium which provided a forum for young researchers to present their results and to get feedback. As varied as the activities were the topics of the conference which covered the presentation of new and improved practices, empirical studies, experience reports and case studies, and last but not least the social aspects of agile methods. The papers and the activities went through a rigorous reviewing process. Each paper was reviewed by at least three Program Committee members and was discussed carefully among the Program Committee. Of 62 papers submitted, only 22 were accepted as full papers.

potential software development clients: Software Rights Gerardo Con Diaz, 2019-10-22 A new perspective on United States software development, seen through the patent battles that shaped our technological landscape This first comprehensive history of software patenting explores how patent law made software development the powerful industry that it is today. Historian Gerardo Con Díaz reveals how patent law has transformed the ways computing firms make, own, and profit from software. He shows that securing patent protection for computer programs has been a central concern among computer developers since the 1950s and traces how patents and copyrights became inseparable from software development in the Internet age. Software patents, he argues, facilitated the emergence of software as a product and a technology, enabled firms to challenge each other's place in the computing industry, and expanded the range of creations for which American intellectual property law provides protection. Powerful market forces, aggressive litigation strategies, and new cultures of computing usage and development transformed software into one of the most controversial technologies ever to encounter the American patent system.
