Frequently Asked Questions

What are the key responsibilities of a system administrator?

A system administrator is responsible for installing, configuring, and maintaining computer systems and servers; managing user accounts and permissions; ensuring system security and backups; monitoring system performance; and troubleshooting hardware and software issues.

How do you manage user permissions in a Linux environment?

User permissions in Linux are managed using file ownership and permission settings. Commands like `chmod`, `chown`, and `chgrp` are used to modify permissions. Additionally, managing groups and using Access Control Lists (ACLs) can provide more granular control over permissions.

What tools do you use for monitoring system performance?

Common tools for monitoring system performance include `top`, `htop`, `vmstat`, `iostat`, `netstat`, and `system`

monitoring solutions like Nagios, Zabbix, Prometheus, or Grafana for more comprehensive monitoring and alerting.

How would you troubleshoot a server that is running slowly?

First, check system resource usage using tools like `top` or `htop` to identify CPU, memory, or disk bottlenecks. Review running processes for unusual activity. Check disk space availability and I/O performance. Analyze logs for errors and verify network connectivity and latency.

What is the difference between a process and a thread?

A process is an independent program in execution with its own memory space, while a thread is a smaller unit of a process that shares the same memory space but can execute independently. Threads are used for concurrent execution within a process.

How do you ensure system security as a sysadmin?

System security can be ensured by regularly applying patches and updates, configuring firewalls, enforcing strong password policies, monitoring logs for suspicious activity, disabling unused services, and implementing access controls and encryption.

What is RAID and which RAID level would you recommend for data redundancy?

RAID (Redundant Array of Independent Disks) is a data storage virtualization technology that combines multiple physical drives into one logical unit for redundancy or performance. RAID 1 (mirroring) or RAID 5/6 (striping with parity) are commonly recommended for data redundancy depending on the balance between performance, capacity, and fault tolerance.

How do you automate routine tasks as a system administrator?

Automation can be achieved using scripting languages like Bash, Python, or PowerShell to write scripts for repetitive tasks. Configuration management tools like Ansible, Puppet, or Chef can also be used to automate deployment, configuration, and management of systems at scale.

What steps would you take to recover from a system crash?

First, assess the situation and identify the cause of the crash by reviewing logs and error messages. Then, restore from backups if necessary. Repair corrupted file systems or hardware if needed. Document the incident and implement measures to prevent future occurrences.

sys admin interview questions: Reforming Teaching and Learning , 2009-01-01 This volume addresses the larger question of the effects of (global) educational reform on teaching and learning as they relate to the context, the policies and politics where reform occurs. Maria Teresa Tatto and Monica Mincu bring together a group of leading scholars in the field representing a variety of national contexts and geographical areas. The chapters in the book raise crucial questions such as: What is the impact of globalization on local education systems and traditions? What roles do international agencies play? What is the role of the state? What is the role of policy networks? How do we understand the functions of quality assurance mechanisms, standards, competencies, and the "new" accountability? In doing so the chapters discuss the institutions and organization of education and how these shape what teachers learn and, eventually, teach to diverse populations. The book uses a number of analytical frameworks and theoretical perspectives, from critical discourse analysis, regime theory, empirical exploration of teachers' thinking and actions within school contexts, analysis of reform diffusion and global trends. Using analysis of the literature and relevant documents, case studies and diverse forms of survey research, this work offers a glimpse of the complexities that exist in the fields of teaching and learning. This collection is also an occasion to observe the profile of knowledge production in these cultural contexts, the interplay between local and national research agendas and traveling policies around the world.
